## NOTES ON SOURCES

The genesis for this project came from a curiosity about Sacramento Northern's caboose fleet and its pedigree. Friends contributed copies of several caboose rosters previously compiled by other fans, which unfortunately were incomplete or were in conflict. This project became an attempt to fill in the information gaps and sort out the conflicts.

The most complete roster was based on research by the late Vernon Sappers. Sappers is said to have consulted records from the Western Pacific shops in Sacramento, as well as other official records and photographic evidence. My copy had a number of corrections, additions and updates by Robert A. Campbell, Sr.

I was also given a summary of Sacramento Northern authorization for expenditures (AFEs) which was found by P. Allen Copeland among corporate records in the Western Pacific Railway offices in San Francisco. Copeland later combined this list with work by John J. Ryczkowski in an article entitled "All Time Roster of Western Pacific Caboose Cars" (FREIGHT CARS JOURNAL, July 1986). There were many points of disagreement between the Copeland and Sappers rosters.

Mistakes probably crept into the rosters because different sources were consulted. The WP corporate records, including AFEs, were kept for accounting purposes, and often did not reflect the facts out on the line. For example, when cars were transferred from the Western Pacific to the Sacramento Northern, they were usually recorded in ascending numerical order on the AFEs. In some cases, the cars were actually numbered differently, perhaps in the order they were relettered. Dates on AFEs are also suspect. Sometimes cars were written off months or even years before or after they were actually acquired or sold. In addition, some AFE records were apparently lost by the time the list Copeland found was compiled, and the summary covers only the years 1928 to 1957. Shop records, on the other hand, were compiled by the men who actually worked on the equipment, and are often a more accurate source. However, shop crews have been known to fudge official records in the interest of getting their work done in the easiest and most timely manner, such as swapping numbers between a derelict car slated for rebuilding, and a better car destined for scrap.

By combining the various sources, plus additional research and comparison with photos, I was able to bring the previous rosters closer to agreement. My roster corrects the very definite transposition of cabooses 1636 and 1637, for example (now confirmed by photographic evidence). It also adds some information on the identity of the early Northern Electric cabooses. On the correct identity of cabooses 1621- 1625, I am less certain, and have included a supplemental sheet showing the differences between various sources. Finally, recent information about the surviving cars was added from information supplied by Roger Kirkpatrick.

Once the caboose roster was well underway, I began compiling the lists of freight and maintenance-of-way cars. These again drew heavily from the Copeland AFE list. This was supplemented by a 1928 Interstate Commerce Commission valuation report on the Sacramento Northern Railway from the National Archives, a 1916 Public Utilities Commission valuation report on the Northern Electric Railway in the California State Archives, and entries from rosters in various copies of the OFFICIAL RAILWAY EQUIPMENT REGISTER (ORER). Except for ORER listings, I was unable to find any documentation on the Oakland, Antioch & Eastern Railway, or its successor, the San Francisco-Sacramento Railroad. Neither the Oakland, Antioch & Eastern nor the Northern Electric Railway were listed in the ORER during their first years, so the identity and disposition of their earliest freight cars remains murky. Nor did I have much luck with the Sacramento Northern's more modern freight cars.

There remain two important archival sources which I was unable to consult. The Western Railway Museum is said to have a tremendous cache of Sacramento Northern materials, including the Sappers collection. Unfortunately, I was not able to gain access to the WRM archives. The California State Railroad Museum library now holds a significant collection of Western Pacific materials known collectively as "The WP President's Papers." These have been in restricted storage since their donation to the museum, and are only now beginning to be catalogued and made available for research.

My comments are in no way meant to discredit the work of any of the previous compilers. They have done a great service to railroad historians, and their generosity in sharing their research is commendable. My own modest contribution is but a continuation and refinement of their work based on additional information I was able to uncover. I fully expect that others will follow and make further corrections or additions to these pages.

Special thanks to Robert A. Campbell, Sr., Kyle Williams Wyatt, Guy Wilber, Allen Wood, Jim Eager, Thom Anderson, and P. Allen Copeland , for their help and encouragement with this project.

## NERY FREIGHT CAR SUMMARY

The Northern Electric Railway began its freight operation with a motley collection of used cars during its construction period. Most probably came from used equipment brokers, or from the contractors that built the line. These included a 28-foot flat car from the Shasta Railway numbered 5, and 28 30-foot flat cars from N. B. Livermore numbered 400-427. None appear in ORER entries. The 1916 California PUC valuation lists these as "other rail equipment", and all were clearly in maintenance-of-way service by that date. While these cars probably did carry occasional freight in the NERY's early days, absent any further documentation, they have not been included in our revenue freight section.

The NERY's revenue fleet really began with cars built by Fitzhugh Luther & Company in 1907. These were 50 36-foot wooden boxcars numbered 2000-2049, and 163 40-foot wooden flat cars numbered 1100-1262. There were also 50 Rodger wooden dump cars numbered 1500-1549 built by the American Car & Foundry. An additional 50 boxcars, also from AC&F, were added in 1908.

Later additions included 40-foot flat cars 1300 to 1459. Their builder was not found in any records so far examined, but some higher numbers in this group were rebuilt from Fitzhugh Luther cars according to the 1928 ICC valuation. The pre-merger Sacramento Northern Railroad upgraded many cars during the 1920s with "economy lift arms", a steel draft gear housing. Many flat cars had gondola sides or beet racks, but were still listed as flat cars in the ORER. In the ICC valuation, flat cars across the entire number span from 1100 to 1459 were mixed at random with gondolas and beet racks, and all three types included original and upgraded underframes. Existing records are not complete enough to sort out the whole flat car story.

Six stock cars, 5000-5005, from an unknown source were added to the roster in 1917. Ballast cars 1700-1749 which appeared at this time were rebuilds of the 1500-series. Six boxcars were built by the SNRR itself in 1919, numbered 2101-2106. They were followed by 21 boxcars from Pacific Car & Foundry, numbered 2107-2127. Like all the line's boxcars up to this point, these had an inside length of 36 feet.

Before 1918, all NERY and SNRR cars had wooden underframes with iron truss rods. They were already obsolete when the first cars were delivered in 1907 (steel underframe cars had been built since at least 1898). Wooden cars were cheap, and could be maintained in the company shops by low-skilled local labor. Since the SNRR was just emerging from bankruptcy in 1918, wooden cars made economic sense.

The line's only automobile car, 2100, was truly unique. This car was rebuilt in 1918, possibly from a wrecked car of New York Central design. Only 36 feet long inside, the car rode on a modern steel underframe and Andrews trucks, both firsts on the SNRR. It had door openings of 10 feet, 2 inches for loading of autos and other large freight. This car was rebuilt as a portable substation in 1938 and survived until around 1960.

The SNRR's first truly modern cars were purchased in 1919. These were 25 40-foot boxcars with steel underframes and wooden bodies. They were built by Mount Vernon Car Company, and were similar to 16001-class boxcars just delivered to the Western Pacific. The SNRR's cars were delivered in late 1919 and early 1920, and were numbered 2129-2153.

Mention should also be made here of boxcar 2249 and series 2280-2288. These were rebuilt in 1923 by the SNRR. Number 2249 was a Fitzhugh-Luther boxcar from the 2000-2049 group. The others were rebuilds of PC&F cars in series 2050-2099. These cars kept their wooden underframes, but photos show at least some received Murphy-type steel roofs.

Attrition of the wooden cars was severe during the 1920s. Although the range spanned nearly 500 cars, many numbers were vacant. Some had been lost or retired, and others had been renumbered during rebuilding. By July 1928, just a few months before the "Great Merger" with the San Francisco-Sacramento Railroad, the SNRY actually had only 280 freight cars. Only the 25 40-foot steel underframe boxcars could be said to be modern, though older cars were still useful for local traffic.

The usual retirements, plus those lost in wrecks and fires, continued to reduce the fleet after the merger. Several cars were reassigned to maintenance-of-way service in 1932. Copeland's AFE list shows a wholesale scrapping of older cars in 1934, with 71 NE boxcars, 60 flat cars, all six stock cars, and the remaining ballast cars, written off for scrap. A few older boxcars and flat cars continued in revenue service through World War II, though their arch bar trucks restricted them to on-line duty after 1941. Most of these were scrapped in 1947, but a few flat cars were still listed in the ORER in 1959. Incredibly, flat car 1449 survived into the 1960s around Walnut Creek and Port Chicago. It was renumbered MW 01449 in 1964. Later this car was donated to the California State Railroad Museum in Sacramento.

The fate of the Mount Vernon boxcars is very interesting. AFE records say the 22 remaining cars from this group were scrapped in 1947. This was not true. They were shoved off into sidings to await later disposition. In 1948, they returned to revenue service as 2329-2350 with AB brakes (and later Andrews trucks on some). Most of the class was gradually downgraded to maintenance-of-way service in the 1960s. A few were still around in the 1970s when they were sold or donated to museums. Two cars from this group are known to survive. The CCRM owns 2350, and 2335 is used as a gift shop in Yountville.

## OA&E FREIGHT CAR SUMMARY

The Oakland, Antioch & Eastern Railway's freight car roster was much smaller than that of the Northern Electric Railway, reflecting a lower freight traffic density. The OA&E began freight operation with just 10 36-foot wooden flat cars built by Holman of San Francisco in 1911, numbers 2000-2009. These were joined by 10 wooden boxcars numbered 3000-3009, also built by Holman and delivered in 1911 and 1912. The boxcars had a 35-foot, 3-inch inside length, and a head-cracking 6-foot, 10-inch ceiling.

The first group was followed by another from Pacific Car & Foundry, which delivered 21 more flat cars in 1913. These were numbered 2010-2030 and, with one exception, were also 36 feet long. The odd-ball was number 4022. Its length is given as 40 and 46 feet in various sources, however, this car may have been stretched in a rebuilding. PC&F also delivered 20 boxcars in 1913, numbered 3010-3029. These were slightly larger than the Holman cars with an inside length of 35 feet, 10 inches, and a more reasonable 8-foot ceiling.

All the OA&E cars had wooden underframes, strengthened by iron truss rods. Steel underframes were common for new cars by 1911, however, no OA&E cars were built or rebuilt to these standards. The entire roster was obsolete from the day it was ordered.

The OA&E also owned 16 ballast cars. These were numbered 0101 to 0116, but despite their obvious company service numbers, they were reported as revenue cars to the ORER. The first six were delivered in 1911, and the remaining 10 in 1913. Ten ballast cars were off the roster before September 1924. Two more were destroyed in 1929. The remaining four cars are unaccounted for. A picture showing two of these very rare cars may be seen on page 123 in Ira Swett's SACRAMENTO NORTHERN.

In 1920, the OA&E was reorganized at the San Francisco-Sacramento Railroad. The SF-S added no new equipment to the roster. Indeed, there is no evidence of any major rebuilding or upgrading program during their eight year management. The only major change seems to have been the addition of end doors to boxcars 3015-3029. The doors were 8 feet, 3 inches wide, and 7 feet, 6 inches wide. These doors were not listed in the 1916 ORER your editor examined, however this might have been an omission, as no doors of any sort (even side doors) are noted in the listings. Curiously, beginning in 1930 the post-merger SN listed most of the surviving cars from both groups with lumber doors in the "A" end. Whether these cars were rebuilt, or always had lumber doors that were ignored by the OA&E/SF-S is not known.

The total number of revenue freight cars during the entire separate existence of both companies was just 77. With the exception of a few cars lost to accidents and disposal of the ballast cars, most of the roster was intact and in original condition at the time of the "Great Merger" into the Sacramento Northern Railway. A number of the cars were quickly scrapped in 1929. A total of 23 more were already in maintenance-of-way service, or were reassigned by 1934. The remainder of the fleet was retired in 1934 during the post-merger house cleaning. Apparently few were ever relettered "Sacramento Northern", as SF-S numbers and lettering are noted for nearly all in Copeland's AFE list. As far as can be determined, no former OA&E/SF-S cars were in revenue service after 1934.

One ex-OA&E car is known to survive. What is believed to be one of the Holman flat cars became tool car MW 32. It survived into the 1960s at Walnut Creek. This car was rescued and preserved by the California State Railway Museum at Sacramento. In May 1999, this car was completely rebuilt using new timbers and the original iron parts as a demonstration project during the Museum's annual Raifair. The Society for Preservation of Carter Railroad Resources, a historical group with much experience rebuilding 19th century narrow gauge equipment, provided the guidance and much of the labor. Unfortunately, the project took longer than expected and the car languished on sawhorses for many months in the CP station area of the museum. The car was finally completed in 2001.

3000-3009 WERE ORIGINALLY LISTED AS 38' 3" LONG.

## SN FREIGHT CAR SUMMARY

Following the "Great Merger" in 1929, the Sacramento Northern Railway was stuck with a roster of obsolete wooden, truss-rod freight cars. Many dated from the original Northern Electric's 1907 order, and from the Oakland, Antioch & Eastern's initial 1911 fleet. Most of these relics were soon scrapped, the largest number in 1934, though some were converted to maintenance-of-way duty. A few newer or rebuilt boxcars continued in revenue service until 1947, and a handful of flat cars were around through the 1950s.

With the exception of boxcar 2100, the entire Sacramento Northern roster rolled on antiquated arch bar trucks. This made them illegal for interchange after 1941, though since SN was a wholly-owned subsidiary, interchange was still allowed with the Western Pacific and the Tidewater Southern. It was not until the late 1940s that any SN cars were fitted with AB brakes, and Andrews trucks were probably added around 1954.

The line's best cars were the Mount Vernon-built steel underframe boxcars 2129-2153, 22 of which were still in service at the time of the merger. These cars served through World War II, but were "retired from service and scrapped" in 1947. In reality, they were simply shoved into sidings to await later disposition. In late 1948, the entire class was rebuilt with AB brakes and returned to revenue service as numbers 2329-2350. They were not given cast trucks until the 1950s, and some continued to roll on their original arch bars until their end in maintenance service during the 1970s. Numbers 2337 and 2350 were still listed as revenue cars as late as 1969.

The 2129-2153 Mount Vernon boxcars were "replaced" in May 1947 by 28 boxcars purchased from the WP and numbered 2301-2328. These came from the WP's 16001-18500 class, and had originally been identical to SN's 2129 class. The WP rebuilt them with steel ends during the late 1920s and early 1930s. Cars from this group still on arch bar trucks were renumbered into series 316001-318500 during the 1930s. Photos of SN's 2301-2328 series shortly after delivery show at least some of this group on arch bar trucks. Since there were no other WP boxcars with this combination of details by then, at least some likely came from the 316001 series. Some finally received Andrews trucks in the early 1950s. Like their wooden-end sisters, a few ~~hung~~ hung around until the early 1970s in maintenance service, and 2326 was still in revenue service in 1969. SN 2302 survives on the Niles Canyon Railway at Sunol, and 2314 is preserved at the Western Railway Museum at Rio Vista Junction.

Beginning in 1955, the WP equipped the SN with modest blocks of new freight cars that were fully up to industry standards. In most cases, they were near duplicates of cars being purchased by the WP itself.

The first group were 100 50-foot, double-door steel boxcars numbered 2401-2499. These were built by Pullman Standard to their famous PS-1 design. These were followed by 20 46-foot inside length drop-bottom gondolas, numbers 4001-4020, which came from American Car & Foundry, also in 1955. AC&F built another group of gondolas in 1959, this time with a 52-foot, 6-inch inside length, no doubt for service to the U.S. Steel mill at Pittsburg.

A group of ten Pullman Standard 47-foot covered hoppers were added in 1958, numbers 5001-5010. Two more blocks of similar cars soon followed, 5101-5109, and the slightly larger 5501-5509. AC&F contributed some even larger cylindrical hoppers in 1961, numbered 5501-5510. The latter cars had "SN" reporting marks and numbers, but carried large "Western Pacific" lettering on their flanks. SN covered hoppers were used in grain service, and also at times for shipping bulk walnuts.

The WP lettering scheme and slogans were also used on insulated boxcars built by Thrall Car Company in 1961. These were delivered in two groups, 8001-8010 and 8011-8040. These were fitted with plug doors and were classed as RBL, or bunkerless refrigerators. They were used to carry canned goods.

SN's last new cars were certainly oddities. Two 60-foot auto parts boxcars with cushioned underframes were built by Thrall in 1969. These were numbered 3735-3736. A third similar car, 3737, came from Maxon in 1970. Their numbers bridged two blocks of WP auto parts cars. The SN cars were classified as XP, suggesting that they joined their WP sisters in pool service to the Ford plant.

By the mid-1970s, the WP had decided to end the SN's separate identity. As cars came due for scrapping, or perhaps as their equipment trusts were paid off, most were renumbered and relettered into the WP roster. Many retained their fading SN display lettering, but their reporting marks were hastily painted over with a simple "WP" and new numbers. A few, like the Thrall insulated boxcars, were extensively rebuilt into new classes along with similar WP cars.

By the time of the WP's merger into the Union Pacific, there were only a handful of SN cars left, and not many survived much longer. A very few of the cars rebuilt by the WP continued to serve the UP into the 1990s, many years after it absorbed the SN.

## SACRAMENTO NORTHERN CABOOSES

The earliest cabooses on the Northern Electric Railway were numbered 601-604, and were similar side-door types. Not much is known about the first three, but 604 is well documented. It was rebuilt from a 35-foot long ex-Southern Pacific boxcar. Cars 601 and 602 did not survive long enough to receive SN numbers, but 603 and 604 became 1603 and 1604 during the "Great Merger". They were retired in December 1941.

NERY's "standard" cabooses were five conventional cars with a 34-foot, 10-inch length. The first was built in 1917. Its builder is unknown. An early picture of this car as NERY 623 may be seen on page 39 of Swett's SACRAMENTO NORTHERN. NERY 623 became SNRR 605 in 1920. It was finally renumbered 1605 in 1921. Two more cars of this type were built in 1920 as SNRR 606 and 607, probably by Pacific Car & Foundry. They were renumbered 1606 and 1607 in 1921. A final pair, numbered SNRY 1610 and 1611, were built by the SN itself in 1928 as part of the capital improvements connected with the new Holland Branch. Cabooses 1605 and 1606 were scrapped in 1948, with 1607 following in 1954. At some point late in its active career, 1611 had its arch bars replaced with Andrews trucks, possibly to allow it to run on the steel trains over the Santa Fe. Finally 1610 and 1611 were retired in 1956. Car 1611 was sold to railfan Hal Wilmunder and was used as crew quarters on his Camino, Cable & Northern tourist railroad in the 1960s. When that line folded, the car was sold as a vacation cabin, and its current status is unknown.

Two small passenger-baggage cars were purchased from the Ocean Shore Railroad in 1921 and converted to cabooses 1608 and 1609. Caboose 1608 had a 45-foot long body. It served until 1948. Caboose 1609, which was over 50 feet long, looked something like a classic drovers caboose with baggage doors, 13 windows per side, and 8-foot long passenger trucks. It became foreman's car MW 51 in 1940. At that time, the baggage doors and five windows on each side were filled in with tongue-and-groove siding. It remained in maintenance-of-way service until burned for scrap at Moraga in 1957.

The final North End caboose was a makeshift affair for the isolated Vacaville-Willota Branch. SN removed the electrical gear from streetcar 22 in 1928. It was never renumbered. This car served until 1939 or 1940 when it became a tool shed on the Holland Branch.

The Oakland Antioch & Eastern Railway had only three small cabooses, all just 21 feet long. These were purchased used in 1913, and had been built by the SP as short cabooses for use on their ferries at Port Costa (which also made them ideal for use on RAMON). Car 51 had end platforms, two windows per side, and no cupola. It became SN 1612 with the merger and lasted until 1934. Caboose 52 was a typical side-door car without end platforms. It had three small windows on each side and the roof was graced by a large cupola with three side windows. It became SN 1613 and served until 1946. The third was 53. It was similar to 51, with end platforms and two windows per side. Possibly it too lacked a cupola when first rebuilt. All known pictures show it as having a large cupola similar to number 52. It became SN 1614 and was also retired in 1946.

The World War II traffic boom left the SN short of cabooses. Three ancient cars were purchased from the Denver & Rio Grande Western in June 1944 (some sources claim they arrived as early as 1942). They had been D&RGW numbers 0805, 0860 and 0870, built by Peninsular Car Co. in 1888, 1891 and 1891 respectively. The cars were renumbered SN 1615-1617. Caboose 1615 was retired in 1948, with 1616 lasting until 1952. Caboose 1617 was wrecked in October 1944 and scrapped the next year.

Between 1948 and 1954, the WP sent the SN nine of their obsolete "Gould Standard" cabooses. These cars were renumbered 1621-1629 (numbers 1618-1620 were left vacant). Some were wooden underframe cars built for the WP by Haskell & Barker in 1910 (1622, 1623, 1625, 1627-1629). They apparently received steel center sills in subsequent rebuildings by the WP. Three others were built new in 1924 by the WP to the same design with steel underframes (1621, 1624, 1626). For most of these cars, their SN service was brief. The last was retired in 1958.

The WP next sent the SN ten of their single-sheathed cupola cabooses between 1956 and 1958. These were numbered 1630-1639. They had been rebuilt in various lots before and during World War II from 15001-series boxcars. Number 1633 had three side windows, the cupola near the end of the car, and full-width end platforms with tender-type steps. The rest had four side windows with the cupola moved slightly toward the car's center. Cars 1631 and 1636 had full-width end platforms with tender-type steps, while 1630, 1632, 1634, 1635 and 1637-1639 had narrow platforms with passenger-type steps.

The final group of SN cabooses also came from the WP, and once again were their oldest cars. These were single-sheathed bay-window cars, numbered 1640-1644, also rebuilt from 15001 boxcars during World War II. The first three arrived in 1961, 1962 and 1964. By the early 1970s, retirement had thinned the cupola cabooses, so two more bay-window cars were transferred in 1972. Cars 1642 and 1644 (along with cupola caboose 1632) are known to have received "Perlman Green" paint to match the GP-7s the WP supplied to the SN in 1971. The WP policy shifted toward total integration of SN in the mid-1970s. Cabooses for SN trains were then drawn from the WP caboose pool. Cars 1641 and 1642 were retired in 1976, the last in a long line of SN cabooses.

## SN MAINTENANCE-OF-WAY CARS

At its peak, the Sacramento Northern Railway operated 275 miles of mainline and branches, all of it powered by third rail or overhead wire. A railroad of this size required a fairly extensive fleet of service equipment, including special cars dedicated to maintaining the power distribution system.

The Northern Electric Railway began its operation with a motley fleet of used cars inherited from their contractors, or purchased from equipment brokers. The 1916 California PUC valuation lists 64 cars in company service, many clearly holdovers from construction. These included the usual collection of bunk and dining cars for crews, various undescribed "outfit cars" which probably included both box cars and flat cars for tools and supplies, 15 flat cars, a water tank car, and a tower car. There were also a ballast plow, a pile driver, and a recently scrapped Marion steam shovel. Ira Swett also has a photo of an unnumbered derrick in his CARS OF SACRAMENTO NORTHERN. Fifty Rodger ballast cars were primarily in company service, but they were listed as revenue cars in the ORER, and are not included here. Many of the cars dated from 1890, indicating that they were purchased used by the NERY. The flat cars had a pitiful 30,000 pound capacity, and most of the others were in the 40,000 pound range. These were clearly not state-of-the-art, even for 1916.

There did not appear to be any serious attempt to group the NERY maintenance cars into one numerical block. Cars were scattered in the 300, 400, 600, 700 and 1000 blocks. Several of the 1907 Fitzhugh-Luther flat cars rebuilt for company service kept their original numbers in the 1100 and 1200 series.

The pre-merger Sacramento Northern Railway had cleared out most of these relics by 1928. The ICC valuation lists only 20 cars in company service. They had been more rationally renumbered 902-927. Many were from the NERY's 1907 and 1908 orders, and included a number of Fitzhugh-Luther cars. The most specialized cars were a pile driver and tender, and an air compressor car.

Less is known about the Oakland, Antioch & Eastern and San Francisco-Sacramento's maintenance cars. Our earliest information is quoted in Ira Swett's CARS OF SACRAMENTO NORTHERN from a 1917 valuation report in the Vernon Sappers collection. It includes a steam shovel, a Brownhoist steam crane, a boom crane mounted on a flat car, a rail bonding car, and a steam locomotive tender. If one considers early retirements from Copeland's AFE list of former OA&E/SF-S cars already in maintenance service, there were also several vaguely described "outfit cars" and "outfit boxcars".

Following the merger, SN service cars were remarked with "MW" before their numbers. The roster continued to have two separate series. Cars numbered in the two digit series were those inherited from the SF-S (probably up to around MW 35). The best of the remaining SF-S cars were added to this group between 1929 and 1932, ending with MW 55. These generally served only on lines south of Sacramento.

Cars numbered MW 902 and above were those inherited from the pre-merger SN, and were used north of Sacramento and on the Holland Branch. This segregation of the two fleets was not followed perfectly, but was used until 1940. MW 942 was the last car added to this series. After 1940, additional service cars were numbered MW 56 upward, regardless of where they were assigned.

Of special interest are the SN's three 7,500 gallon water tanks, MW 66-68. These were purchased in used 1937, though the source is unknown. They are typical of AC&F tanks built around 1910, but according to tank car expert Ed Kaminski, no tanks of this capacity were built by that company, and they were probably knock-offs of the AC&F design. At least two of the cars were equipped with a large box next to their domes, probably to protect water hoses and possibly gasoline-powered pumps. Although they probably had a number of duties, the tanks were most often used for fire control on weed burner trains.

Until the end of passenger service in 1941, the SN did not use powered service equipment. Three former OA&E motors, combine 1009 and coaches 1019 and 1020 were retained as maintenance cars. They became MW 300-302 respectively. MW 300 and MW 301, no longer needed as power cars on the dieselized north end, were demotorized in 1947 and converted to kitchen car MW 80 and dormitory MW 81. MW 81 is preserved at the Western Railway Museum. MW 302 continued to serve as a powered car on the south end until her electrical equipment burned up in 1955. The demotorized car became MW 82 on paper, but was not relettered. She is also preserved at the WRM, restored as non-powered trailer OA&E 1020.

Nearly all the remaining wooden cars were converted to maintenance service in the years immediately after World War II, particularly in 1947 and 1954, replacing many older cars that were worn out. Specialized cars, like tower cars, pole flats, and tool cars assigned to the line gang, were also scrapped as the wires came down. Several 2301-2328 and 2329-2350 boxcars became maintenance cars by the early 1950s.

The last car to be renumbered into the old maintenance series was flat car MW 94, converted in 1954. After that year, all cars converted simply had "MW 0" [zero] crudely painted in front of their original numbers. In time even this practice stopped. By the 1960s most remaining wooden cars were in maintenance service, whether relettered or not. Most SN maintenance cars disappeared in the 1960s, replaced by cars from the Western Pacific. A few 2301 and 2329-series boxcars remained as supply cars until the mid-1970s when they were donated to museums or sold off for commercial purposes.

## SACRAMENTO NORTHERN SERVICE EQUIPMENT

## SN PORTABLE SUBSTATIONS

Sacramento Northern's portable substations are among the most mysterious cars in the railroad's complex history. There is some material on these cars in valuation reports, but often this raises more questions than it answers. Much confusion stems from the cars being listed in various sources under *three* different numbering schemes. They are variously numbered as substation cars, with a different number based on the substation's *location*, and by the *original numbers of the flat cars from which they were built*. The number of portables constantly changed as new cars were added, and older cars had their equipment moved into permanent structures. It is enough to keep a researcher awake at night with worry (it has).

Boxcar bodies for Northern Electric Railway's portables and their accompanying transformer cars were built on existing flat cars in Chico shops around 1907 or 1908, if conversion dates for the transformer cars given in the California PUC's 1916 valuation report are also correct for the substations. These cars were permanently sited on the main line at Encinal, Regio and Esquon. As the system expanded, additional cars were converted for Stohlman on the Colusa Branch, and Elkhorn on the Woodland Branch. All were replaced by fixed structures, a process that took years due to NERY's 1914 bankruptcy.

The late Vernon Sappers identified three NERY portable substations in Ira Swett's SACRAMENTO NORTHERN (1948 edition). He listed these as numbers 1-3. This is supported by a photo in Swett's CARS OF SACRAMENTO NORTHERN showing portable No. 1 at Regio in 1909. However, there certainly were more portables than the three Sappers mentioned.

According to the PUC valuation, the NERY owned at least five substation cars and several transformer cars by 1916. These were listed by location numbers, but the valuation also identifies the original cars from which they were built: No. 4 at Esquon (ex-1210); No. 5 at Encinal (ex-1007); No. 5A at Stohlman (ex-1140); No. 9 at Regio (ex-1110, and transformer car ex-1163); and an unnumbered unit at Elkhorn (ex-1180, with transformer car 419). There were two unattached transformer cars in the "Other Rail Equipment" section, Nos. 2 and 605. These might have been mates to the two unaccompanied substation cars. As permanent structures replaced the portable substations, the cars were apparently returned to general maintenance-of-way duty.

R. W. Van Norden's article "The Northern Electric Railway" (in the April 1910 issue of THE JOURNAL OF ELECTRICITY, POWER & GAS; reprinted in Swett's SACRAMENTO NORTHERN, 1981 edition), lists locations 5 and 9 (no names given) with portable units. Van Norden describes the substation at location 5 as "two boxcars--one containing transformers, the other the substation proper". C. G. Young's 1911 report, also cited in Ira Swett's SACRAMENTO NORTHERN, lists portables at location 5 (Esquon) and location 9 (Regio). An added note mentions new substations at Stohlman and Elkhorn, but gives no details.

All NERY substations, both portable and permanent, used similar equipment. Each had a Westinghouse 400 kilowatt, 600 volt D.C. generator of 580 horsepower. This was driven by a Westinghouse type CCL 2200 volt A.C., three-phase induction motor. The motor, generator and feeder panels were made by General Electric.

The Oakland, Antioch & Eastern apparently had only one portable substation. This is mentioned in Swett's CARS OF SACRAMENTO NORTHERN, and is based on a 1917 valuation report from the Sappers collection, but no number is given. It had a 350 kilowatt capacity at 1200 volts DC. The equipment from this car was eventually removed from the car and mounted as a fixed unit inside the shop building at Oakland. It boosted power for trains past 42nd Street on the stiff climb up the Oakland Hills.

In 1919, the new Sacramento Northern Railroad built another portable substation. It was christened No. 1 (2nd). This unit was said to be the first automatic portable substation on any interurban railroad in the United States. Unlike earlier NERY substations, the rotary convertor set of this unit was built by General Electric. No. 1 was intended from the beginning to be a true portable, serving only temporarily wherever needed, though it spent most of its years at the Mulberry Shops at Chico. Following the closure of the in 1951, No. 1 was permanently sited at the Western Pacific shops in Sacramento. Here it powered two short tracks upon which electric locomotives were repaired and tested. No longer needed when the last electric operation ended at Yuba City in 1965, No. 1 was donated to the Bay Area Electric Railroad Association. Today it supplies power to their Western Railway Museum at Rio Vista Junction.

In April 1938, the Sacramento Northern Railway built its last portable substation, No. 2. This was a 600 volt rotary convertor unit housed in former automobile car 2100. The car was 36 feet long, had double side doors over a 10-foot, 2-inch opening, and rode on a steel underframe. The car was used primarily inside the Oakland shops, ~~wherever needed~~. After the end of electric service between Oakland and Lafayette, the car hung around Concord and Port Chicago until burned for scrap about 1960. The electrical equipment from No. 2 is said to have been sold to the Orange Empire Railway Museum in Perris, California (this is not confirmed by the OERM).
